

# PARKINSON'S DISEASE

Cell fate: apoptosis, senescence, differentiation

Extracellular matrix organization, coagulation and lipoprotein metabolism

GPCR signaling: Wnt, metabotropic receptors, cytokine receptors

Interferon stimulated genes: interleukins and antigen presentation

Neurotransmission

NFkB mediated inflammation induced by TLRs, TCRs and BCRs

NOTCH and FOXO mediated gene expression

Response against viruses via TGF-SMAD signaling

Response to stress: autophagy, mitophagy, heatshock response

Signal transduction upon growth factor stimulation

Unfolded protein response (UPR)
